## Practical Machine Learning

# Lecture 5 <br> Support Vector Machine (SVM) and Kernel trick 

Dr. Suyong Eum

## A question from the last class

How do we infer $\mathrm{p}(\mathrm{Z} \mid \mathrm{X})$ using $q(Z)$ ?

- Only data $X$ are given
- $p(X, Z)$ is known

$$
p(Z \mid X)=\frac{p(X, Z)}{p(X)}=\frac{p(X, Z)}{\sum_{Z} p(X, Z)}
$$

- When the variable $z$ is continuous
- When the number of variables $z$ is many (?)

|  | Resource | Time | Accuracy |
| :---: | :---: | :---: | :---: |

| Sampling <br> (Numerical approach) | Worse | Worse | Good |
| Variational Inference <br> (Analytical approach) | Medium | Medium | Medium |

## Laplace approach

$\square$ Finding the mode of the posterior distribution and then fitting a Gaussian centered at that mode.

$$
\begin{aligned}
& p(z) \propto \exp \left(-z^{2} / 2\right)\left(1+\exp ^{-20 z-4}\right)^{-1} \\
& p(z)=\frac{1}{C} f(z) \quad C=\int f(z) d z \quad \begin{array}{l}
\text { Normalizing factor, } \\
\text { which is unknown }
\end{array} \\
& \left.\frac{d f(z)}{d z}\right|_{z=z_{0}}=0 \quad A=-\left.\frac{d^{2}}{d z^{2}} \ln f(z)\right|_{z=z_{0}} \\
& \text { It becomes mean of } q(z) \quad \text { It becomes precision of } q(z)
\end{aligned}
$$

$$
\mathrm{N}\left(x \mid \mu, \sigma^{2}\right)=\frac{1}{\left(2 \pi \sigma^{2}\right)^{1 / 2}} \exp \left\{-\frac{1}{2 \sigma^{2}}(x-\mu)^{2}\right\}
$$

$$
q(z)=\left(\frac{A}{2 \pi}\right)^{1 / 2} \exp \left\{-\frac{A}{2}\left(z-z_{0}\right)^{2}\right\}
$$

$$
\frac{\mathrm{d}^{2}}{\mathrm{dx}^{2}} \ln \mathrm{~N}\left(x \mid \mu, \sigma^{2}\right)=-\frac{1}{\sigma^{2}}
$$

## Sampling approach

## Sampling approach

$$
p(B, E, A, J, M)=p(B) p(E) p(A \mid B, E) p(J \mid A) p(M \mid A)
$$

$$
p(B, E, J \mid A, M) ?
$$

$$
p(E \mid B, A, J, M)=p(E \mid A, B)
$$

$$
\begin{aligned}
p(E, A, B) & =p(A \mid B, E) p(B) p(E) \\
p(E, A, B) & =p(E \mid A, B) p(A, B) \\
& =p(E \mid A, B) p(A \mid B) p(B)
\end{aligned}
$$

$$
p(A \mid B, E) p(B) p(E)=p(E \mid A, B) p(A \mid B) p(B)
$$

$$
p(E \mid A, B)=\frac{p(A \mid B, E) p(E)}{\sum_{E} p(A \mid B, E)}
$$

## Variational inference

The idea is

- Finding $p(Z \mid X)$ by minimizing Kullback divergence to $q(Z)$
- Minimizing $K L$ between $p(Z \mid X)$ and $q(Z)$ is equivalent to maximizing a function where the conditional distribution $p(Z \mid X)$ is replaced with the joint distribution $p(Z, X)$.
- Factorizing the joint distribution on the assumption that the latent variables $Z$ are independent.
- Developing the derivation in terms of one latent variable on the assumption of the other latent variables are known.
- Then, do some algebra..
$\square$ Refer the backup slides which include the derivation

## Where we are <br> Where we are

## You are going to learn

$\square$ An idea of Support Vector Machine (SVM)

- Problem formulation of SVM
- Linear classification: Hard Margin SVM
$\square$ Non-linear classification
- Soft Margin SVM
- Kernel trick

## Why Support Vector Machine?

$\square$ Most widely used classification approach (practical)

- Linearly separable data set
- Linearly separable data set with a few violation
- Non-linearly separable data set
- Supported by well defined mathematical theories
- Geometry,
- Optimization,
- Quadratic programming,
- Lagrange method,
- Kernel, etc.
- Kernel,

$\square$

one is better for class

\section*{Terminology used in this lecture}

\[
y(\mathrm{x})=w_{2} x_{2}+w_{1} x_{1}+w_{0}
\]
\[
\begin{array}{ll}
\boldsymbol{X}_{2} & y\left(\mathrm{x}^{\mathrm{a}}\right)=w_{2} x_{2}^{\mathrm{a}}+w_{1} x_{1}^{\mathrm{a}}+w_{0}=0 \\
y\left(\mathrm{x}^{\mathrm{b}}\right)=w_{2} x_{2}^{\mathrm{b}}+w_{1} x_{1}^{\mathrm{b}}+w_{0}=0
\end{array}
\]
\[
\begin{aligned}
y\left(\mathrm{x}^{a}\right)-y\left(\mathrm{x}^{b}\right) & =w_{2} x_{2}^{a}+w_{1} x_{1}^{a}+w_{0}-w_{2} x_{2}^{b}-w_{1} x_{1}^{b}-w_{0} \\
& =w_{2}\left(x_{2}^{a}-x_{2}^{b}\right)+w_{1}\left(x_{1}^{a}-x_{1}^{b}\right) \\
& =\left[w_{1}, w_{2}\right]\left[\begin{array}{c}
x_{1}^{a}-x_{1}^{b} \\
x_{2}^{a}-x_{2}^{b}
\end{array}\right] \quad(1 \times 2)(2 \times 1)=(1 \times 1) \\
0 & =\mathrm{w}^{\mathrm{T}}\left(\mathrm{x}^{a}-\mathrm{x}^{b}\right)
\end{aligned}
\]
\[
\begin{aligned}
& \mathrm{x}=\left(x_{1}, x_{2}\right) \\
& \mathrm{w}=\left(w_{1}, w_{2}\right)
\end{aligned}
\]
\[
\mathrm{w}^{\mathrm{T}} \perp\left(\mathrm{x}^{a}-\mathrm{x}^{b}\right)
\]

Vector on the decision boundary

\section*{Some geometry}
\(\square\) Inner product
\(\left(x_{1}^{a}, x_{2}^{a}\right) \cdot\left(w_{1}, w_{2}\right)=\left\|\left(x_{1}^{a}, x_{2}^{a}\right)\right\|\left\|\left(w_{1}, w_{2}\right)\right\| \cos \theta\)
\[
\cos \theta=\frac{\|d\|}{\left\|\left(x_{1}^{a}, x_{2}^{b}\right)\right\|} \Rightarrow\|d\|=\left\|\left(x_{1}^{a}, x_{2}^{b}\right)\right\| \cos \theta
\]

\section*{\(\square \cos \theta\) definition}
\[
\left\|\left(w_{1}, w_{2}\right)\right\|\|d\|=\left(x_{1}^{a}, x_{2}^{b}\right) \cdot\left(w_{1}, w_{2}\right)
\]
\[
\|d\|=\frac{w_{2} x_{2}^{a}+w_{1} x_{1}^{a}}{\left\|\left(w_{1}, w_{2}\right)\right\|}=\frac{-w_{0}}{\left\|\left(w_{1}, w_{2}\right)\right\|}
\]
\[
\|d\|=\frac{-w_{0}}{\|\mathrm{w}\|}
\]

\footnotetext{

}

 -

\section*{Margin distance}
\[
\mathrm{X}^{c}=\mathrm{X}^{b}+\|r\| \frac{\mathrm{W}}{\|\mathrm{~W}\|} \text { Unit vector showing } \begin{gathered}
\text { Size of the vector } \\
\left(\mathrm{x}^{\mathrm{b}}->\mathrm{x}^{c}\right)
\end{gathered} \text { the direction only }
\]
\[
w_{2} x_{2}+w_{1} x_{1}+w_{0}=y(\mathrm{x})
\]
\(\square\) Let's multiply \(\mathrm{w}^{\top}\) and add \(\mathrm{w}_{0}\) in both sides.
\[
\begin{aligned}
& \mathrm{w}^{\mathrm{T}} \mathrm{x}^{\mathrm{c}}+\mathrm{w}_{0}=\mathrm{w}^{\mathrm{T}} \mathrm{x}^{b}+\mathrm{w}_{0}+\mathrm{w}^{\mathrm{T}}\|r\| \frac{\mathrm{W}}{\|\mathrm{~W}\|} \\
& \mathrm{y}\left(\mathrm{x}^{\mathrm{c}}\right)=\mathrm{w}^{\mathrm{T}}\|r\| \frac{\mathrm{W}}{\|\mathrm{~W}\|} \\
& \|r\|=\frac{\mathrm{y}\left(\mathrm{x}^{\mathrm{c}}\right)}{\|\mathrm{w}\|} \quad \begin{array}{c}
\text { Let's say } \\
\|r\|=\frac{1}{\|\mathrm{w}\|}
\end{array}
\end{aligned}
\]
\[
\begin{array}{r}
\boldsymbol{X}_{2} \\
w_{2} \mathrm{x}_{2}+w_{1} x_{1}+w_{0}=y(\mathrm{X}) \\
\mathrm{w}^{\mathrm{T}} \mathrm{x}^{c}+w_{0}=y\left(\mathrm{x}^{\mathrm{c}}\right) \\
\mathrm{w}^{\mathrm{T} \mathrm{x}^{b}+w_{0}=0}
\end{array}
\]

\section*{Problem formulation}
- Finding a decision boundary which maximizes the margin.
\(\max \|r\|=\frac{1}{\|\mathrm{w}\|}\)
s.t.
\[
t_{n} y\left(\mathrm{x}_{n}\right)>0 \quad \begin{aligned}
& \text { Every data points are } \\
& \text { classified correctly. }
\end{aligned}
\]
\[
\begin{cases}t_{n}=+1, & y\left(\mathrm{x}_{n}\right)>0 \\ t_{n}=-1, & y\left(\mathrm{x}_{n}\right)<0\end{cases}
\]
\[
w_{2} x_{2}+w_{1} x_{1}+w_{0}=0
\]

\section*{Problem formulation}

Let's make it a quadratic programming problem.
\[
\max \frac{1}{\|\mathrm{w}\|}
\]
s.t. \(\quad t_{n} y\left(\mathrm{x}_{n}\right)>0, \quad \forall n\)

Do you remember?
\(\max \frac{1}{\|\mathrm{w}\|}\) Let's say
\(\left|\mathrm{y}\left(\mathrm{x}^{\mathrm{c}}\right)\right|=1\)
s.t. \(\quad t_{n} \mathrm{y}\left(\mathrm{x}_{n}\right) \geq 1, \quad \forall n\)
meaning that any data point is away from the decision boundary at least 1

\[
w_{2} x_{2}+w_{1} x_{1}+w_{0}=0
\]

Finally
\[
\begin{array}{ll}
\min & \frac{1}{2}\|\mathrm{w}\|^{2} \\
\text { s.t. } & t_{n}\left(\mathrm{w}^{\mathrm{T}} \mathrm{x}_{n}+w_{0}\right) \geq 1, \quad \forall n
\end{array}
\]

\section*{Quadratic programming}

\section*{How about non-linearly separable case?}
\[
\begin{array}{ll}
\min & \frac{1}{2}\|\mathrm{w}\|^{2} \\
\text { s.t. } & t_{n}\left(\mathrm{w}^{\mathrm{T}} \mathrm{x}_{n}+w_{0}\right) \geq 1, \quad \forall n
\end{array}
\]

\section*{Approaches}

Option 1 Soft margin SVM
Option 2 Kernel trick

\begin{tabular}{|l|l|}
\hline & \multicolumn{1}{|c|}{ Approaches } \\
\hline Option 1 & Soft margin SVM \\
\hline Option 2 & Kernel trick \\
\hline
\end{tabular}

\section*{Soft margin SVM}

\section*{Option 1: soft margin SVM}
Remember the constraint below?
\[
t_{n}\left(\mathrm{w}^{\mathrm{T}} \mathrm{x}_{n}+w_{0}\right) \geq 1, \quad \forall n
\]
\(\square\) For the data points which are non-separable, we relax the constraint:
\[
t_{n}\left(\mathrm{w}^{\mathrm{T}} \mathrm{x}_{n}+w_{0}\right) \geq 1-\varepsilon_{n} \quad \forall n \quad \varepsilon_{n} \geq 0
\]
\(\square\) It says that the distance between a data point and the decision boundary is allowed to be less than 1.
\(\square \varepsilon_{n}\) is called slack variables.
\(\square\) Question. Where is a data point when \(\varepsilon_{n}=1\) ?

\section*{Option 1: soft margin SVM}

So we have the constraint below. How about the objective function?
\[
t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right) \geq 1-\varepsilon_{n} \quad \forall n \quad \varepsilon_{n} \geq 0
\]
\(\square\) We want to minimize the slack.
\(\min \frac{1}{2}\|\mathrm{w}\|^{2}+C \sum_{n} \varepsilon_{n}\)
\(\square\) If " \(C\) " is small, the slack contributes more
1) Prefer large margin
2) May cause large \# of misclassified data points.
\(\square\) If "C" is large, the slack contributes less
1) Prefer less \# of misclassified data points.
2) May cause small margin.

\section*{Option 1: soft margin SVM}
\[
\begin{gathered}
\mathbf{w}^{\mathrm{T}} \mathbf{X}+w_{0}=1 \\
\mathbf{w}^{\mathrm{T}} \mathbf{X}+w_{0}=0 \\
\mathbf{w}^{\mathrm{T}} \mathbf{X}+w_{0}=-1
\end{gathered}
\]
\(\square\) The formulation finally becomes
\[
\begin{aligned}
& \min \frac{1}{2}\|\mathrm{w}\|^{2}+C \sum_{n} \varepsilon_{n} \\
& \text { s.t. } \\
& t_{n}\left(\mathrm{~W}^{\mathrm{T}} X_{n}+w_{0}\right) \geq 1-\varepsilon_{n}, \forall n \\
& \varepsilon_{n} \geq 0
\end{aligned}
\]

都

Kernel trick

\section*{Lagrange method for an optimization problem with inequality constraints}

\section*{\(\min x^{2}\) \\ s.t. \(\quad x \geq b\)}

\[
\begin{aligned}
& \min _{x} \max _{\lambda} x^{2}-\lambda(x-b) \\
& \text { s.t. } \quad \lambda \geq 0
\end{aligned}
\]
- Minima is zero when \(b \leq 0\)
- Minima is " \(b^{2 \prime}\) " when \(b>0\)
- It means at optima: \(\lambda(\mathrm{x}-\mathrm{b})=0\) (complementary slackness)
- Maximizing \(\lambda\) results in minimizing the objective value
- \(\lambda \geq 0\) (it should be because \(x-b \geq 0\) )

\section*{Convert the quadratic problem in SVM to Lagrange optimization problem}

\section*{KKT conditions}

Primal problem
) Stationarity condition
\[
\frac{\partial}{\partial \mathrm{w}} \frac{1}{2} \mathrm{w}^{T} \mathrm{w}-\frac{\partial}{\partial \mathrm{w}} \sum_{n=1}^{n} \lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+\mathrm{w}_{0}\right)-1\right)=0
\]
2) Complementary slackness condition
\[
\lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right)-1\right)=0
\]
3) Duality feasibility condition
\[
\lambda_{n} \geq 0
\]
\[
\begin{aligned}
& \min _{\mathrm{w}} \max _{\lambda} \frac{1}{2} \mathrm{w}^{T} \mathrm{~W}-\sum_{n=1}^{n} \lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right)-1\right) \\
& \text { s.t. } \quad \lambda_{n} \geq 0
\end{aligned}
\]
\(\square\) We would like to convert again the optimization problem above into another form, which provides same results.
- Because we want to solve the optimization problem in term of "lagrange multiplier \(\left(\lambda_{n}\right)\) ".
\[
\begin{aligned}
& \max _{\lambda} \min _{\mathrm{w}} \frac{1}{2} \mathrm{w}^{T} \mathrm{w}-\sum_{n=1}^{n} \lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right)-1\right) \\
& \text { s.t. } \lambda_{n} \geq 0
\end{aligned}
\]

\section*{Dual problem of the quadratic problem: applying stationarity condition}
\[
\begin{aligned}
& \max _{\lambda} \min _{\mathrm{w}, \mathrm{w}_{0}} L\left(\mathrm{w}, \mathrm{w}_{0}, \lambda\right)=\frac{1}{2} \mathrm{w}^{\mathrm{T}} \mathrm{w}-\sum_{n=1}^{N} \lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right)-1\right) \\
& \mathrm{W}=\sum_{n=1}^{N} \lambda_{n} t_{n} x_{n} \quad \sum_{n=1}^{N} \lambda_{n} t_{n}=0 \\
& L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{X}_{n}^{T} \mathrm{X}_{m}-\sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{X}_{n}^{T} \mathrm{X}_{m}-\sum_{n=1}^{N} \lambda_{n} t_{n} w_{0}+\sum_{n=1}^{N} \lambda_{n} \\
& \max _{\lambda} L(\lambda)=\sum_{n=1}^{N} \lambda_{n}-\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{x}_{n}^{T} \mathrm{x}_{m}
\end{aligned}
\]
\[
\begin{aligned}
& \max _{\lambda} L(\lambda)=\sum_{n=1}^{N} \lambda_{n}-\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{x}_{n}^{T} \mathrm{x}_{m} \\
& \text { s.t. } \quad \lambda_{n} \geq 0, \quad \sum_{n=1}^{N} \lambda_{n} t_{n}=0 \\
& \min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} x_{n}^{T} x_{m}-\sum_{n=1}^{N} \lambda_{n} \\
& \text { s.t. } \quad \lambda_{n} \geq 0, \quad \sum_{n=1}^{N} \lambda_{n} t_{n}=0
\end{aligned}
\]
\(\square\) Again, the optimization problem becomes a quadratic programming problem.

\section*{Let's summarize}
\[
\begin{gathered}
\min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} x_{n}^{T} \mathrm{x}_{m}-\sum_{n=1}^{N} \lambda_{n} \\
\text { s.t. } \quad \lambda \geq 0, \quad t^{T} \lambda=0
\end{gathered}
\]
\(\square\) The solution from the quadratic programming is "lagrange multipliers" \(\left(\lambda_{n}\right)\)
\(\square\) Many of the solutions (lagrange multipliers) are zero
\(\square\) Complementary slackness (one of KKT conditions) should be satisfied.
\[
\lambda_{n}\left(t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right)-1\right)=0
\]
\(\square\) In other words, if \(\lambda_{n}\) are not zero, \(\left(t_{n}\left(w_{t} x_{n}+w_{0}\right)-1\right)\) should be zero where corresponding data points should be support vectors.
\(\square\) With the non-zero \(\lambda_{n}\), w and \(w_{0}\) can be calculated using \(t_{n}\left(w_{t} x_{n}+w_{0}\right)=1\)
\[
\mathrm{w}=\sum_{n=1}^{N} \lambda_{n} t_{n} x_{n} \quad w_{0}=t_{n}-\sum_{n=1}^{N} \lambda_{n} t_{n} x_{n} x_{n}
\]

\section*{Kernel trick}
\[
\begin{aligned}
& \min \frac{1}{2} \mathrm{w}^{T} \mathrm{~W} \\
& \text { s.t. } t_{n}\left(\mathrm{w}^{\mathrm{T}} x_{n}+w_{0}\right) \geq 1
\end{aligned} \quad \min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{x}_{n}^{T} \mathrm{x}_{m}-\sum_{n=1}^{N} \lambda_{n}
\]
\(\square\) If data \(x_{n}\) are not linearly separable, what should we do?

Space Z

\section*{Kernel trick}
\(\square\) The idea of Kernel trick begins from here: to find the scalar values (the inner product of two vectors: \(z_{n}\) and \(z_{m}\) ) and so we can formulate the quadratic problem which can be linearly separable.

\[
\begin{gathered}
\min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} x_{n}^{T} \mathrm{x}_{m}-\sum_{n=1}^{N} \lambda_{n} \\
\text { s.t. } \quad \lambda \geq 0, \quad t^{T} \lambda=0
\end{gathered}
\]

Space X
\(\square\)

\[
\begin{gathered}
\min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} z_{n}^{T} z_{m}-\sum_{n=1}^{N} \lambda_{n} \\
\text { s.t. } \lambda \geq 0, \quad t^{T} \lambda=0
\end{gathered}
\]

Space Z

\[
=1
\]
\[
2+m+a+m
\]

路

\section*{Kernel trick}
\(\square\) Kernel function \(K()\) is a function which returns the scalar values (the inner product of two vectors:
\(z_{n}\) and \(z_{m}\) in \(Z\) space) when the data points ( \(x_{n}\) and \(x_{m}\) in \(X\) space) are given.
\[
K\left(\mathrm{x}_{n}^{T}, \mathrm{x}_{m}\right)=\phi\left(\mathrm{x}_{n}^{T}\right) \phi\left(\mathrm{x}_{m}\right)=\mathrm{z}_{n}^{T} \mathrm{z}_{m}
\]
Space Z
\[
2
\]
\[
-
\]
\(\square\) \(K\left(\mathrm{X}_{n}^{T}, \mathrm{X}_{m}\right)=\phi\left(\mathrm{X}_{n}^{T}\right) \phi\left(\mathrm{X}_{m}\right)=\mathrm{Z}_{n}^{T} \mathrm{Z}_{m}\)

\(\square\) With the Kernel function defined previously, we want to change the quadratic problem as follows:
- Because the Kernel function is a function of data points ( \(x_{n}\) and \(x_{m}\) ) which we already have.
\[
\begin{gathered}
\min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} z_{n}^{T} z_{m}-\sum_{n=1}^{N} \lambda_{n} \\
\text { s.t. } \quad \lambda \geq 0, \quad t^{T} \lambda=0
\end{gathered}
\]
\[
\begin{aligned}
\min _{\lambda} L(\lambda) & =\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} \mathrm{~K}\left(\mathrm{x}_{n}^{T} \mathrm{x}_{m}\right)-\sum_{n=1}^{N} \lambda_{n} \\
\text { s.t. } & \lambda \geq 0, \quad t^{T} \lambda=0
\end{aligned}
\]
\[
\min _{\lambda} L(\lambda)=\frac{1}{2} \lambda^{T}\left[\begin{array}{cccc}
t_{1} t_{1} K\left(\mathrm{x}_{1}, \mathrm{x}_{1}\right) & t_{1} t_{2} K\left(\mathrm{x}_{1}^{T}, \mathrm{x}_{2}\right) & \cdots & t_{1} t_{N} K\left(\mathrm{x}_{1}^{T}, \mathrm{x}_{N}\right) \\
t_{2} t_{1} K\left(\mathrm{x}_{2}, \mathrm{x}_{1}\right) & t_{2} t_{2} K\left(\mathrm{x}_{2}^{T}, \mathrm{x}_{2}\right) & \cdots & t_{2} t_{N} K\left(\mathrm{x}_{2}^{T}, \mathrm{x}_{N}\right) \\
\ldots & \cdots & \cdots & \cdots \\
t_{N} t_{1} K\left(\mathrm{x}_{N} \mathrm{x}_{1}\right) & t_{N} t_{2} K\left(\mathrm{x}_{N}^{T}, \mathrm{x}_{2}\right) & \cdots & t_{N} t_{N} K\left(\mathrm{x}_{N}^{T}, \mathrm{x}_{N}\right)
\end{array}\right] \lambda+\left(-1^{T}\right) \lambda
\]
- Now you have a function, which classifies a data point in z space without mapping
the data point to \(z\) space at all.
\(\square\) Do you see why it is called a trick?
\[
\min _{\lambda} L(\lambda)=\frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} t_{n} t_{m} \lambda_{n} \lambda_{m} K\left(\mathrm{x}_{n}^{T} \mathrm{x}_{m}\right)-\sum_{n=1}^{N} \lambda_{n}
\]
\[
\text { s.t. } \quad \lambda \geq 0, \quad t^{T} \lambda=0
\]
\(\mathrm{W}=\sum_{z_{n} \in S V} \lambda_{n} t_{n} \mathrm{z}_{n} \quad w_{0}=t_{n}-\sum_{z_{n} \in S V} \lambda_{n} t_{n} z_{n} z_{n}=t_{n}-\sum_{z_{n} \in S V} \lambda_{n} t_{n} K\left(\mathrm{x}_{n}, \mathrm{x}_{n}\right)\)
\(\operatorname{sign}\left(\mathrm{w}^{\mathrm{T}} \mathrm{z}+\mathrm{w}_{0}\right)\)
\[
\begin{aligned}
& \operatorname{sign}\left(\sum \lambda_{n} t_{n} \mathrm{z}_{n} \mathrm{z}+t_{n}-\sum_{z_{n} \in S V} \lambda_{n} t_{n} K\left(\mathrm{x}_{n}, \mathrm{x}_{n}\right)\right) \\
& \operatorname{sign}\left(\sum \lambda_{n} t_{n} K\left(x_{n}, x\right)+t_{n}-\sum \lambda_{n} t_{n} K\left(x_{n}, x_{n}\right)\right)
\end{aligned}
\]

\section*{Polynomial kernel of degree 2}

Space X
\[
\begin{aligned}
K(\mathrm{x}, y) & =(\mathrm{xy})^{2} \\
& =\left(\left(x_{1}, x_{2}\right) \cdot\left(y_{1}, y_{2}\right)\right)^{2} \\
& =\left(x_{1} y_{1}+x_{2} y_{2}\right)^{2} \\
& =x_{1}^{2} y_{1}^{2}+2 x_{1} x_{2} y_{1} y_{2}+x_{2}^{2} y_{2}^{2}
\end{aligned}
\]

\[
\begin{aligned}
\phi(\mathrm{x}) \phi(y) & =\left(x_{1}^{2}, \sqrt{2} x_{1} x_{2}, x_{2}^{2}\right) \cdot\left(y_{1}^{2}, \sqrt{2} y_{1} y_{2}, y_{2}^{2}\right) \\
& =x_{1}^{2} y_{1}^{2}+2 x_{1} x_{2} y_{1} y_{2}+x_{2}^{2} y_{2}^{2}
\end{aligned}
\]

Mapping to 3-dimension

\section*{Gaussian Kernel: derivation (inner product in the infinite z space)}
\[
\begin{aligned}
K\left(\mathrm{x}_{n}, \mathrm{x}_{m}\right) & =\exp \left(-\alpha\left\|\mathrm{x}_{\mathrm{n}}-\mathrm{x}_{\mathrm{m}}\right\|^{2}\right) \\
& =\exp \left(-\alpha \mathrm{x}_{n}^{2}\right) \exp \left(-\alpha \mathrm{x}_{m}^{2}\right) \exp \left(2 \alpha \mathrm{x}_{n} \mathrm{x}_{m}\right) \\
& =\exp \left(-\alpha \mathrm{x}_{n}^{2}\right) \exp \left(-\alpha \mathrm{x}_{m}^{2}\right) \sum_{k=0}^{\infty} \frac{(2 \alpha)^{k}\left(\mathrm{x}_{\mathrm{n}}\right)^{k}\left(\mathrm{x}_{\mathrm{m}}\right)^{k}}{\mathrm{k}!} \\
& =\sum_{k=0}^{\text {Taylor series expansion of }} \begin{array}{l}
\frac{(2 \alpha)^{k}}{k!} \\
\exp (x)=\frac{x^{0}}{0!}+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{3}}{3!}+\cdots
\end{array} \\
& =\phi\left(-\alpha \mathrm{x}_{n}^{2}\right)\left(\mathrm{x}_{\mathrm{n}}\right)^{k} \sqrt{\frac{(2 \alpha)^{k}}{k!}} \exp \left(-\alpha \mathrm{x}_{m}^{2}\right)\left(\mathrm{x}_{\mathrm{m}}\right)^{k}
\end{aligned}
\]

\section*{Variational inference: derivation}
\[
\begin{aligned}
& K L(q(Z) \| p(Z \mid X))=-\sum_{Z} q(Z) \log \frac{p(Z \mid X)}{q(Z)} \longrightarrow \text { Finding } q(Z) \text { which minimizes the Kullback divergence } \\
&=-\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z) p(X)} \\
& K L=-\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z)}+\sum_{Z} q(Z) \log p(X) \\
& K L+\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z)}=\sum_{Z} q(Z) \log p(X)
\end{aligned}
\]

\section*{,}

\section*{Variational inference: derivation}
\(\square K L\) divergence and lower bound are a function of " \(q(Z)\) "
\(\square\) Minimizing KL divergence is equivalent to maximizing the lower bound (L).
\[
\begin{aligned}
& K L=-\sum_{Z} q(Z) \log \frac{p(Z \mid X)}{q(Z)} \quad \\
& L=\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z)} \quad \text {. We do not have this conditional distribution } \\
&=\text { We do have the joint distribution }
\end{aligned}
\]
\[
\begin{aligned}
& K L+\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z)}=\sum_{Z} q(Z) \log p(X) \quad \text { • } 4-8=-1 \\
& \text { - Always positive - Always Negative } \\
& \text { - Lower bound (L) } \\
& \text { - Always negative } \\
& \text { - It is a fixed value } \\
& \text { - } 1-2=-1 \\
& \text { - Always negative } \\
& \text { elis a fixed value }
\end{aligned}
\]

\section*{Variational inference: derivation}
\[
\begin{aligned}
\max & L=\sum_{Z} q(Z) \log \frac{p(X, Z)}{q(Z)} \\
& =\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log \frac{p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)}{q\left(z_{1}\right) q\left(z_{2}\right)} \quad \text { Assuming that } z_{1} \text { and } z_{2} \text { are independent } \\
& =\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right)\left[\log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\log q\left(z_{1}\right) q\left(z_{2}\right)\right] \\
& =\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right)\left[\log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\log q\left(z_{1}\right)-\log q\left(z_{2}\right)\right] \\
& =\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log q\left(z_{1}\right)-\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log q\left(z_{2}\right)
\end{aligned}
\]

\section*{Variational inference: derivation}
\[
L=\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log q\left(z_{1}\right)-\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log q\left(z_{2}\right)
\]

Assuming that \(\mathrm{q}\left(\mathrm{z}_{2}\right)\) is known, and so we just look for \(\mathrm{q}\left(\mathrm{z}_{1}\right)\)
\(=\sum_{z_{1}} \sum_{z_{2}} q\left(z_{1}\right) q\left(z_{2}\right) \log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right) \sum_{z_{2}} q\left(z_{2}\right)-\sum_{z_{1}} q\left(z_{1}\right) \sum_{z_{2}} q\left(z_{2}\right) \log q\left(z_{2}\right)\)
\(=\sum_{z_{1}} q\left(z_{1}\right) \sum_{z_{2}} q\left(z_{2}\right) \log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right) \sum_{z_{2}} q\left(z_{2}\right)-\sum_{z_{1}} q\left(z_{1}\right) \sum_{z_{2}} q\left(z_{2}\right) \log q\left(z_{2}\right)\)
\(=\sum_{z_{1}} q\left(z_{1}\right) E_{z_{2}}\left[\log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)\right]-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right)-K \sum_{z_{1}} q\left(z_{1}\right)\) It is one but we keep it for a while
\(=\sum_{z_{1}} q\left(z_{1}\right)\left[E_{z_{2}}\left[\log p\left(x_{1}, x_{2}, z_{1}, z_{2}\right)\right]-K\right]-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right)\)

\section*{Variational inference: derivation}
\[
\begin{aligned}
L= & \sum_{z_{1}} q\left(z_{1}\right)\left[E_{z_{2}}[\log p(X, Z)]-K_{1}-K_{2}\right]-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right) \\
& \quad \log f(X, Z)=E_{Z_{2}}[\log p(X, Z)]-K_{1} \\
& f(X, Z)=e^{E_{z_{2}}[\log p(X, Z)]-K_{1}}=e^{-K_{1}} e^{E_{z_{2}}[\log p(X, Z)]}=C e^{E_{E_{2}}[\log p(X, Z)]} \\
& \text { If we choose "C" carefully,f(X,Z) can be a probability distribution. } \quad \iint C e^{E_{z_{2}}[\log p(X, Z)]} d X d Z=1 \\
L= & \sum_{z_{1}} q\left(z_{1}\right)\left[\log f(X, Z)-K_{2}\right]-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right) \\
= & \sum_{z_{1}} q\left(z_{1}\right) \log f(X, Z)-\sum_{z_{1}} q\left(z_{1}\right) K_{2}-\sum_{z_{1}} q\left(z_{1}\right) \log q\left(z_{1}\right) \\
= & \sum_{z_{1}} q\left(z_{1}\right) \frac{\log f(X, Z)}{\log q\left(z_{1}\right)}-\sum_{z_{1}} q\left(z_{1}\right) K_{2}=\sum_{z_{1}} q\left(z_{1}\right) \frac{\log f(X, Z)}{\log q\left(z_{1}\right)}+C^{\prime}
\end{aligned}
\]

\section*{Variational inference: derivation}
\[
\begin{aligned}
& L=\sum_{z_{1}} q\left(z_{1}\right) \frac{\log f(X, Z)}{\log q\left(z_{1}\right)}-\sum_{z_{1}} q\left(z_{1}\right) K_{2}=\sum_{z_{1}} q\left(z_{1}\right) \frac{\log f(X, Z)}{\log q\left(z_{1}\right)}+C^{\prime} \\
& \log f(X, Z)=E_{z_{2}}[\log p(X, Z)]-K_{1} \quad \text { We defined it previously } \\
& f(X, Z)=e^{E_{z_{2}}[\log p(X, Z)]-K_{1}}=e^{-K_{1}} e^{E_{z_{2}}[\log p(X, Z)]}=C e^{E_{z_{2}}[\log p(X, Z)]}
\end{aligned}
\]

Lower bound \((L)\) is maximized when \(\log q(z 1)\) and \(\log p(X, Z)\) are equal because it is a negative \(K L\). Thus, ...
\[
\begin{aligned}
\log q\left(z_{1}\right) & =\log f(X, Z) \\
q\left(z_{1}\right) & =f(X, Z)=C_{1} e^{E_{z_{2}}[\log p(X, Z)]}=C_{1} e^{\sum_{2} q\left(z_{2}\right) \log p(X, Z)} \\
q\left(z_{2}\right) & =f(X, Z)=C_{2} e^{E_{z_{1}}[\log p(X, Z)]}=C_{2} e^{\sum_{z_{1}} q\left(z_{1}\right) \log p(X, Z)}
\end{aligned}
\]```
