

Perceptron algorithm (with Python)

Tutorial 2 Yang

- ▶ The perceptron algorithm is an example of a linear discriminant model (two-class model)

How to implement the Perceptron algorithm with Python?

Tutorial 2

Through this tutorial, you will know:

- ◆ How to load training and testing data from files
- ◆ How to import the packages
- ◆ How to train the model by the training data
- ◆ How to make predictions with the testing data
- ◆ How to plot the figures illustrated the algorithm
- ◆ How to tune the parameters in the models

Homegrown libraries and third-party application:

- For scientific computing: `>>> import somelibrary`
- ◆ Numpy: provide high-performance vector, matrix and higher-dimensional data structures for Python
- ◆ SciPy: based on the low-level Numpy framework and provides a large number of higher-level scientific algorithms
- ◆ matplotlib: an excellent 2D and 3D graphics library for generating scientific figures
- ◆ Pandas: a python package providing fast, flexible and expressive data structures for easy and intuitive data analysis and data manipulation
- ◆ **scikit-learn**: a open-source machine learning library, simple and efficient tools for data mining and data analysis

Perceptron Algorithm

Algorithm PerceptronTrain(linearly separable set R)

```
1.  $\mathbf{w} \leftarrow \mathbf{w}^{(0)}; b \leftarrow b^{(0)}; \text{MaxIter} = 100$  #Initialize weight, bias and iteration number
2. for  $t$  in range of 0 to  $\text{MaxIter}$  do
3.   choose each  $(x, y) \in R$ 
4.    $a \leftarrow \mathbf{w}^T * \mathbf{x} + b$  #compute activation function
5.   if  $y \neq \text{sign}(a)$  then
6.      $\mathbf{w}^{(t+1)} \leftarrow \mathbf{w}^{(t)} + \eta * y * \mathbf{x}^t$  #update the weights
7.      $b^{(t+1)} \leftarrow b^{(t)} + \eta * y$  #update bias
8.   else
9.      $\mathbf{w}^{(t+1)} \leftarrow \mathbf{w}^{(t)}$   $b^{(t+1)} \leftarrow b^{(t)}$ 
10.  end if
11. end for
12. return  $\mathbf{w}, b$ 
```

Algorithm PerceptronPredict($\mathbf{w}, b, \hat{\mathbf{x}}$)

```
1.  $a \leftarrow \mathbf{w}^T * \hat{\mathbf{x}} + b$  #compute activation for testing data
2. return  $\text{sign}(a)$ 
```

Example

◆ Assessing credit card application

Age	23 years old
Annual salary	NTD 1,000,000
Year in job	0.5 year
Current debt	200,000

Result:

Approved, 1

Rejected, -1

Abstract the
feature vector

Training data:

x_1	x_2	y
0.8	2.6	1
1.3	2	-1
2.2	1.4	-1
2.1	2.8	1
\vdots	\vdots	\vdots

Testing data:

x_1	x_2	y
0.8	2.6	?
1.3	2	?
2.2	1.4	?
2.1	2.8	?
\vdots	\vdots	\vdots

Example

As $w_0 = b$, $x_0 = 1$, initialization $W=[1,1]$, $b=1$, and $\eta=0.1$

$W' = [b, 1, 1]$, $\mathbf{x} = [1, x_1, x_2]$,

1. $a = W^T * \mathbf{x} = 1 + 0.8 + 2.6 = 4.4 > 0$,
 $f(a) = 1$ is the same with $y = 1$,
return W and b

2. $a = W^T * \mathbf{x} = 1 + 2.2 + 1.4 = 4.6 > 0$,
 $f(a) = 1$ is different with $y = -1$,

update W and b :

$W = [1,1] + \eta * y * [2.2, 1.4] = [0.78, 0.86]$

$b = b + \eta * y = 1 + 0.1 * (-1) = 0.9$

.....

Repeat until MaxIter times

Training data:

x_1	x_2	y
0.8	2.6	1
1.3	2	-1
2.2	1.4	-1
2.1	2.8	1
\vdots	\vdots	\vdots

If $\eta=1$, $W=[1.2, 0.4]$, $b=0$

Import the packages

#Import modules and packages

import os

import numpy **as** np

import pandas **as** pd

from sklearn.linear_model **import** Perceptron

import matplotlib.pyplot **as** plt

Load the data into pandas

```
#get the path of current directory
```

```
path=os.getcwd()
```

```
# load data
```

```
traindata=pd.read_csv(path+'¥¥traindata.csv') # Loading data from CSV into pandas
```

```
train_x=traindata.iloc[:, :-1]
```

```
train_y=traindata.iloc[:, -1]
```

```
testdata=pd.read_csv(path+r'¥testdata.csv')
```

```
test_x=testdata.iloc[:, :-1] #Position based selection: - except last column
```

```
test_y=testdata.iloc[:, -1] - Select only the last column
```

The perceptron function

```
# introduce the perceptron
```

```
MaxIter=20
```

```
per=Perceptron(max_iter=MaxIter, eta0=0.1,shuffle=True)
```

```
per.fit(train_x, train_y)
```

```
Test_y=pd.Series(per.predict(test_x), name='y')
```

```
testdata=test_x.join(Test_y, how='outer')
```

```
#write the predict results to file
```

```
testdata.to_csv(path+r'¥test.csv', index=False)
```

Parameters of Perceptron

```
class sklearn.linear_model.Perceptron (penalty=None, alpha=0.0001, fit_intercept=True, max_iter=None, tol=None, shuffle=True, verbose=0, eta0=1.0, n_jobs=1, random_state=0, class_weight=None, warm_start=False, n_iter=None)
```

[\[source\]](#)

Parameters:

Penalty: The penalty (aka regularization term) to be used. Defaults='None'

shuffle: Whether or not the training data should be shuffled after each epoch, default= 'True'

eta0: Constant by which the updates are multiplied, default=1

max_iter: The maximum number of passes over the training data. It only impacts the behavior in the fit method, and not the partial_fit. Default=5, or 1000(from v0.21)

n_iter: The number of passes over the training data. Default=None. Deprecated from v0.19 will be removed in v0.21)

Attributes:

coef_: array, shape = [1, n_features] if n_classes == 2 else [n_classes, n_features]; Weights assigned to the features.

intercept_ : array, shape = [1] if n_classes == 2 else [n_classes]; Constants in decision function.

n_iter_ : int; The actual number of iterations to reach the stopping criterion. For multiclass fits, it is the maximum over every binary fit.

http://scikit-learn.org/stable/modules/generated/sklearn.linear_model.Perceptron.html

Plot the training and test data

```
#plot the train data set
label=train_y.copy()
label[label<0]=0          #set the label to (0,1)
label=label.astype(int)
label=label.values
colormap=np.array(['r','b'])
plt.scatter(train_x.iloc[:,0], train_x.iloc[:,1], marker='o', c=colormap[label])

#plot the test data set
labelt=Test_y.copy()
labelt[labelt<0]=0
labelt=labelt.astype(int)
labelt=labelt.values
plt.scatter(test_x.iloc[:,0], test_x.iloc[:,1], marker='+', c=colormap[labelt])
```

Plot the hyperplane

```
#calculate the hyperplane
w=per.coef_[0]
xx=np.linspace(0, 4)
yy=-(w[0]*xx+per.intercept_[0])/w[1]

#plot the line
plt.plot(xx, yy, 'k-', label='$hyperplane$')
plt.title(u'Iteration = %d' % MaxIter)
plt.legend()

plt.savefig(path+'¥¥perceptron.png')
plt.show()
```

Accuracy rate

```
#calculate the accuracy rate for inseparable data sets
```

```
count=0
```

```
for i in range(len(Test_y)):
```

```
    if test_y.iloc[i]==Test_y.iloc[i]:
```

```
        count+=1.0
```

```
accuracy=count/float(len(Test_y))*100
```

```
print ('Accuracy rate: %.2f%%' % accuracy)
```

Example result

x_1	x_2	y
1.8	2.6	-1
0.6	2.4	-1
1.3	1.6	1
1.7	2.0	1
2.3	2.1	1
2.2	3.2	-1
1.8	2.8	-1
3.0	3.2	-1

Exercise 1: Simple Perceptron classifier and plot the results

- ▶ Copy the files of training data and testing data and Store in specified folder in your laptop
- ▶ Open a CMD window, change the directory path to the one stored the files - 'cd directory path'
- ▶ Run the jupyter notebook - 'jupyter notebook'
- ▶ Copy the codes and paste in the jupyter file
- ▶ Plot the training data and testing data
- ▶ Plot the hyperplane

Exercise 2: Observe the behaviours of Perceptron for shuffle

- ▶ Create 8 subplots (2×4)
 - max iteration is set from 6 to 20 every 2 steps
 - Plot the training data
 - Plot the hyperplane
- ▶ Create 8 subplots (2×4)
 - shuffle is set to False
 - max iteration is set from 6 to 20 every 2 steps
 - Plot the training data
 - Plot the hyperplane

Exercise 3: Comparing the behaviours for η_0

- ▶ Create 8 subplots (2×4)
 - η_0 is set to different value
 - max iteration is set from 6 to 20 every 2 steps
 - Plot the training data
 - Plot the hyperplane
 - `print(w)`

Exercise 4: Train the data by SGDClassifier

- ▶ Create 8 subplots (2*4)
 - Use the SGDClassifier function for classification
 - eta0 is set to 1
 - max iteration is set from 6 to 20 every 2 steps
 - Plot the training data
 - Plot the hyperplane
 - Comparing the behaviours for shuffle and eta0 to perceptron function

Exercise 5: How to select model by Accuracy rate

- ▶ Load the data from datafile.csv
- ▶ Partitioning it into S parts: $S - 1$ is training data, remaining for testing
- ▶ Calculate the accuracy rate and repeat for all S possible choices
- ▶ Change the function from perceptron to SGDClassifier
- ▶ Tune the parameter for the model and observe

$S = 4$,
Repeat for 4 runs
